Aptima® Multitest Swab Collection Kit		Clinician or patient collected vaginal swab, Clinician collected male urethral swab					✓	✓

* HSV/STI testing must be ordered in conjunction with other testing on a single specimen, as it cannot be performed on material previously processed.

Using the latest molecular nucleic acid amplification tests (NAAT), our Vaginitis Panel reports each of the following:

Bacterial vaginosis: Targets *Gardnerella vaginalis*, *Atopobium vaginae* & *Lactobacillus species* and returns a simple qualitative BV positive or negative result.

CV/TV: Differentiates between Candida species group (composed of *C. albicans*, *C. tropicalis*, *C. parapsilosis*, *C. dubliniensis*) and *C. glabrata* to aid in determining the most appropriate antifungal therapy for patients, and confirms the presence of a *Trichomonas vaginalis* infection (recommended by the CDC in all women seeking treatment for vaginal discharge). All are reported with either a positive or negative result.
